This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                     NEIGHBORING SEQUENCE INFORMATION:

He orientation of this clone is unknown. Actual start of this clone is at base position 1 of H_RG083M05; actual end is at 56093 of H_RG083M05
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /gene="WUGSC:H_RG083M05.1"

Clone CTB-10G5 is from the first release of the human BAC library
CITB-9788X-B. The library contains cloned DNA from the male
fibroblast cell line 9788X. See: Shizuya et al., Proc. Natl. Acad.
Sci. USA 89:8794-7 (1992); U-J. Kim et al., Genomics 34:213-8
(1996), This clone is available from Research Genetics, Inc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA 5 (bases 1 to 149194)
                                                                                                                                                                                                                                                                                                                                                                                         Direct Submission

                                                                                                                                                 Submitted (16-NOV-2000) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. Louis, MO 53108, USA 6 (base 1 to 149194) Waterston, R.H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                    Louis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RFS-911H5, 200 base pair
overlap. Actual start of this clone is at base position 195 of
CTB-10G5; actual end is at base position 150532 of CTB-10G5.
                                                                                                                                                                                                                                                                                Submitted (03-JAN-2002) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. MO 63108, USA 7 (bases 1 to 149194) Waterston, R.H.

                                                                                                                                  8
                                                The present sequence represents a multiple sclerosis (MS) associated retrovirus (MSRV) genomic fragment used in the method of the invention. The invention provides complete or partial genomic sequences of the MSRV-genes, gag gene and env gene, and polypeptides encoded by these polypeptides. The invention also provides antibodies raised against the polypeptides. The genomic sequences, polypeptides and antibodies are also claimed useful for diagnosing infection by MS and rheumatoid arthritisassociated viruses, and also for prevention and treatment of infection with these viruses

                        This sequence represents clone 5M6 from a novel multiple sclerosis related virus type 1 (MSRVI). The sequence can be used in diagnostic, prophylactic or therapeutic compositions to inhibit expression of a multiple sclerosis related virus and/or virus associated with rheumatoid polyarthritis. (Updated on 27-ANG-2003 to correct OS field.) (Updated on 17-OCT-2003 to standardise OS field)

                      The invention relates to an isolated or purified nucleic acid from a virus associated with multiple sclerosis and/or rheumatoid arthritis, virus associated with multiple sclerosis and/or rheumatoid arthritis, comultiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise proteins or defined peptides (including immunodominant peptides, conserved motifs). Also included are a process for detecting a virus associated with multiple sclerosis or rheumatoid arthritis, a correst associated with multiple sclerosis or rheumatoid arthritis, a primer for the amplification by polymerisation of a nucleic acid of a virus associated with multiple sclerosis or rheumatoid arthritis, a properties and a nucleic acid probe for the detection of a virus associated with multiple sclerosis or rheumatoid arthritis, a polypeptide exhibiting an inhibitory activity on the correctly; a polypeptide exhibiting an inhibitory activity from MSRV, and an antibody directed against the MSRV-1 virus obtained by immunologically reacting a human or animal body or cells with an immunologically reacting a human or animal body or cells with an exposure to a virus associated with multiple sclerosis or rheumatoid arthritis or for the nucleic acids are useful for detecting a biological sample, the presence of or exposure to a virus associated with multiple sclerosis or rheumatoid arthritis. The present caseduced with multiple sclerosis or rheumatoid arthritis. The present consisting of the patent do not match the SEQ ID numbers in the sequence listing. Consequences mentioned in the case and the sequences the authors intended to claim.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in activity and can be used to must ineoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       reening for anti-neoplastic agent involves exposing cells to a chemical ant to be tested for anti-neoplastic activity, and determining a change expression of a gene of a signature gene set.

                                                                                                                                                                                                                                                                                                                  The present invention describes isolated polynucleotide sequences (I), which encode polypeptides (II) with biological activity. Also described: (I1) a vector comprising (I); (2) an expression vector comprising (I); (3) a host cell genetically engineered to comprise (I) which is operatively associated with a regulatory sequence that modulates expression of (I) in the host cell; (4) a polypeptide (II) encoded by (I); (5) a composition comprising the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4) and a carrier; (6) an antibody directed against the polypeptide of (4); (7) detecting (I) or the polypeptide of (4) in a sample; (8) identifying a compound that binds to the polypeptide of (4); (7) detecting (I) or the polypeptide of (4); (7) detecting (I) or the polypeptide of (4); (7) detecting (I) or the polypeptide of (9) producing the polypeptide of (4); and the polynucleotides sequences (I). The polynucleotides (I) can be used as hybridisation probes, oligomers or primers, for chromosome or gene mapping, for the recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       '; genetic engineering; hybridisation probe; oligomer; mapping; gene mapping; recombinant protein production;

Sequiacory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immunotherapy. HERV-7q peptides and their coding sequences can be used in immunogenic or vaccinating compositions, for
